Working near overhead power lines?

UTAH'S OVERHEAD LINE SAFETY ACT

To protect those working near overhead power lines from accidental contact, the Utah Legislature enacted the High Voltage Overhead Line Safety Act.

The law provides that no construction activity is to take place within 10 feet* of an overhead power line until these two requirements are met:

The responsible party must notify the utility operating the line of the intended construction activity.

The responsible party and the utility must complete mutually satisfactory precautions for the activity.

*Employers: Note that under Utah OSHA the 10 feet required clearance increases for lines with greater than 50,000 volts in accordance with a formula based on actual voltage.

We'll work with you.

At no charge to you and as soon as you inform Brigham City Light & Power of your intended construction activity, we will work with you on appropriate precautions. Our response may include any or all of the following:

Coordinate construction schedules.

Place temporary mechanical barriers to prevent contact with the lines.

Temporarily de-energize and ground the lines.

Temporarily raise or move the lines.
