Subject: Pressurized Irrigation

As you are all well aware we have been constructing the pressurized irrigation system for some time now. The system will be operational this spring. On the reverse side of this flyer is a diagram that illustrates a typical residential connection to the pressurized irrigation system. It also shows a typical disconnect from the drinking water (culinary) system. It is unlawful for these two systems to be connected at the same time even with a shut off valve in-between the two systems. The two systems must be physically disconnected from one another to avoid potential contamination. Please call Salem City at the number listed and schedule an inspection before you bury your piping systems. Our water department is gearing up for a busy summer getting the new system into operation and is ready to help however we can to make this transition as smooth and safe as possible. We are anticipating water delivery to begin sometime between April 15 and May 1, 2008. It has been a hard winter and the roads have really taken a beating. The contractor is required to perform all repairs resulting from the system installation prior to final payment. We greatly appreciate your cooperation and patience.
