Your One Stop Outfitter For A Mission

4 steps to Bug Protection worldwide 8.17

1- Pre treating Clothing before you leave with special binders & Permethrin for Clothing Bug Protection Worldwide

ILC Travel Outfitters now can pretreat your clothing to be Bug Repellent & Bed Bug Protected BEFORE you leave on your Mission for a small fee

From CDC Website: Prevention is by far the most effective and inexpensive way to protect oneself from these pests.

Pre treating Clothing *before* you leave with Duration with fabric binders:

Not only does this product *repel* insects, but will actually *kill* mosquitoes, ticks, chiggers, mites and more than 55 other kinds of insects. Duration repellent is for use on your clothing and other gear.

Our 10% single application procedure yields 32 ounces for "ONE" spraying that gives additional protection for up to a "Two year" period on clothing. Place 8 ounces of 10% Permethrin into 32 ounce spray bottle and apply on clothing so that you can visualize ALL fibers are wet.

***(Note: *Best option* for ultimate bug protection. Clothing that can be worn for "2" Twelve month time periods for elders, Or "2" Nine month periods for sisters, leave ½ the clothing in sealed compression bags with Silica gel Packets until time to use, then wash & dry as instructed. Place 4 ounces of 10% Permethrin into 32 ounce spray bottle and apply on clothing so that you can visualize ALL fibers are wet.)**

During the drying process it tightly bonds with the fibers of the treated garment. It will not stain or damage clothing, fabrics, plastics, finished surfaces, or any of your outdoor gear. Permethrin clothing treatments, when applied following *Directions for Use*, have been determined to have "spatial repellency" against mosquitoes. This means that mosquitoes will swarm around you, but not land on your treated clothing and bite. Use by itself, or with skin applied repellents to build the ultimate protective barrier. Permethrin is a contact insecticide but non-toxic to humans. Used on bed, will kill bed bugs.

2- Dry weather protection:

A- In areas of extreme bug density use 30% DEET lotion in morning application and when swarming occurs OR extreme conditions you can use 100% Deet spray. Our Low-Odor 100% DEET will achieve this through extra refinement which results in a purer DEET. Protects exposed skin areas against mosquitoes, chiggers, fleas, gnats and ticks. A little goes a long way... so use as needed. You can control dosage by using a smaller amount rather than a lower concentration. Lower concentrations have more alcohol, which increases absorption and causes more skin irritation. **Don't use on face.** (with lotion approx 30 days per 3 ounces with pea size application for arms and neck) Use 1 spray per 2 lotions approximately, for long term calculations)

Application directions: Lotion in morning for up to 11 hours of protection, then when swarming takes place Spray 100% and rub in. (Use 20% Picaridin lotion OR spray for face protection)

B- 20% Picaridin Premium Insect Repellent - use 20% Picariden lotion in morning application and when swarming occurs use 20% Picaridin spray. Spray Picaridin is a promising new insecticide; its effect is similar to DEET, yet it is safer on gear and equipment than DEET. At 20%, this long lasting topical insect repellent is effective up to 14 hours against **mosquitoes, ticks, biting flies, gnats, chiggers and fleas. Picaridin is more effective at repelling biting flies than DEET.** Our 20% Picaridin is virtually odorless; It has a mild citrus scent added to it which quickly evaporates away. WILL NOT HARM GEAR OR EQUIPMENT! **Perfect to use on your face.**

Application directions: Lotion in morning for up to 14 hours of protection, then when swarming takes place use Spray and rub in. (with lotion approx 25-30 days per 3 ounces with pea size application for arms, face and neck)

3- Bed Bug Safety

Two options here: Natural Products have Peppermint oil & Clove oil OR Permethrin, Use on Beds before making them and receive weeks of protection. Spray on carry bags & Luggage for weeks of dead bugs also. For *dry clean only clothing* treat every 6 to 8 weeks for protection. (On inside lining)

For short trips: Use Bed Bug Patrol (Clove oil, Peppermint & Sodium Lauryl Sulfate... ie Soap). Spray on mattress and have 14 days of protection, kills bugs and eggs.

Missionary note: Use on Scripture bags, shoulder bags and Dry clean only suits to prevent the spread of bed bugs. Use a single application every 6 to 8 weeks.

4- Wet weather protection using Essential Oils 8.2017

Part 1-

REFILLABLE BAND

Worn around the wrist, belt loop or ankle, this comfy neoprene band comes with two refills of proprietary essential oil formula.

Easy-to-adjust hook and loop fittings work for both kids and grown-ups. **Place it by your bed at night for extra protection.**

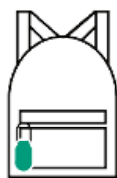

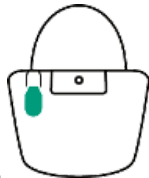

FEATURES

- All day, all zones, all climates
- Easy to use
- For the entire family
- Waterproof
- Assembled in the US
- Up to 15 consecutive days efficacy per refill
- Refill made in France - Patented diffusion

HOW IT WORKS

A single refill pellet fits safe and snug in the mesh pocket on the outside of the band. As the natural oils' active ingredients are released into the air around you, they help to mask the scents of your breath and body, making it harder for mosquitoes to find you. Super simple, super effective. Insert the active pellet into the band. Wear it on your wrist or ankle, or just keep it nearby

ACTIVE INGREDIENTS: • Citronella 34% • Rosemary oil 22% • Geranium Oil • Mint oil 10%
• Clove oil 2.5% • Peppermint oil 1.5%

Part 2- Spray between storms to protect

DIRECTIONS FOR USE

Shake closed applicator before use. Remove cap, then spray on neck, arms, legs or other exposed areas as shown.

Reapply as needed or at least every three (3) to five (5) hours or after swimming. Apply more frequently and over larger skin areas depending on mosquito infestation levels. To improve the efficacy and your personal protection level, do the following as appropriate: apply sufficient quantities, reapply after perspiration/swimming/bathing, cover exposed skin areas and avoid areas and times when mosquitoes are most active.

HOW IT WORKS

This liquid repellent works both as a barrier and a mask. Applied directly to exposed areas of skin — such as the ankles, wrists and neck — it immediately forms a physical barrier between you and the mosquito. As the natural oils' active ingredients are released into the air around you, they also help to mask the scents of your breath and body, making it harder for mosquitoes to find you in the first place. • Shake before use • Spray on your skin adjusting the number sprays and area according to the infestation level • **ACTIVE INGREDIENTS:** • Citronella • Eucalyptus Oil • Tea Tree oil

FEATURES

- Naturally intense
- Up to five hours
- Spray made in Utah
- Not waterproof
- Not suitable for pregnant women or children younger than six (6) months old
- **Precise topical application (Use to reduce itch IF bitten)**
- Highly portable
- Dermatologically tested
- Not suitable for persons with sensitive skin
